Accomplishment of TB and AD should be entered into list page 8-1 and signed by inspector.

DESCRIPTION OF SYSTEMS

AILERON CONTROLS

Aileron system activated via pushrods guided in longitudinal motion ball bearings. Connection of system by automatic coupling during rigging (Hänle system). Ailerons partly mass balanced.

ELEVATOR CONTROLS

Elevator system activated via pushrods guided in longitudinal motion ball bearings. Automatic coupling during assembly of horizontal tail unit. 100% mass balance in vertical tail fin pushrod.

RUDDER CONTROLS

Rudder system activated via steel cables guided in polyamide tubing, no closed control circuit. 100% mass balance at rudder.

WHEEL BRAKE

Feet operated, activated by bowden cable from rudder pedals.

AIR BRAKES

Activated via pushrods guided partly in longitudinal motion ball bearings. Automatic connection of system during rigging (Hänle system). Upper surface double height air brakes with flexible cover blades. Friction damper in box to prevent oscillations during extension.

WATER BALLAST SYSTEM

One tank per wing, maximum capacity per wing 75 Liters (19.8 US gallons, 16.5 Imp. gallons), optionally 50 Liter tanks (13.2 US gal., 11.0 Imp. gal.) are available. Valves at wing root, loading and dumping orifice on under side of wings near root. Automatic connection during rigging. In the vertical tail fin either battery receptacle or ballast tank allowing to compensate C.G. movement due to wing water ballast, maximum capacity 5.5 Liters (1.45 US gallons, 1.21 Imp. gallons). When the tail fin tank is combined with a battery receptacle, the maximum capacity is 4.1 Liters (1.08 US gal., 0.9 Imp. gal.).

COCKPIT

Double fiberglass shell. Controls for airbrakes, longitudinal trim (acting as trim position indicator also) located on left cockpit side, trim locking lever at control stick. Control for tow cable release on left cockpit frame (operating C.G. hook and optional nose hook), for pedal adjustment on seat, for ventilation on instrument panel cover, for landing gear and water ballast valve on right side of cockpit, for canopy opening on both sides. When operating right canopy lever over full possible travel, the forward canopy mounting becomes unlocked (emergency canopy release).

CANOPY

One piece hinged up front with instrument panel. A spring loaded peg at the canopy frame rear edge acts as temporary hinge for clean separation from the fuselage during emergency jettison. Optional camera mounts may be bonded to canopy frame.

INSTRUMENT PANEL

Panel lifting together with canopy. Depending on version, allows for installation of up to 10 instruments including radio.

BAGGAGE COMPARTMENT

Baggage compartment behind pilot's shoulders is for light and soft materials only. Permanent installation of batteries or other equipment possible.

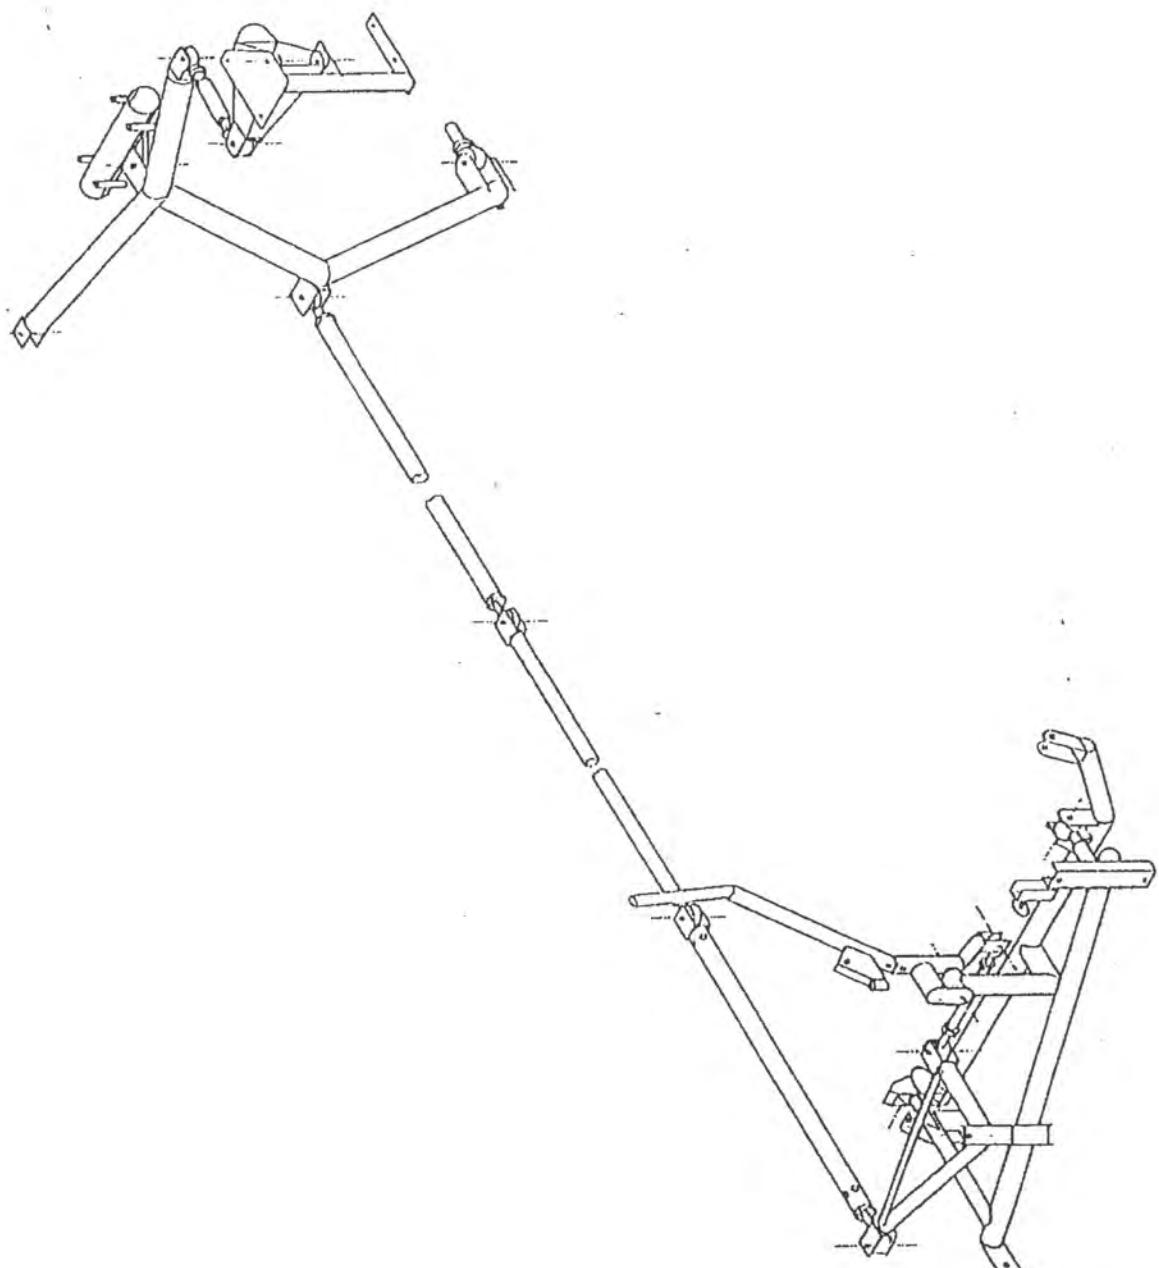

OXYGEN SYSTEM

Receptacle for oxygen bottles provided, size of bottles 3 or 4 liters, diameter 100 mm (3.94 in).

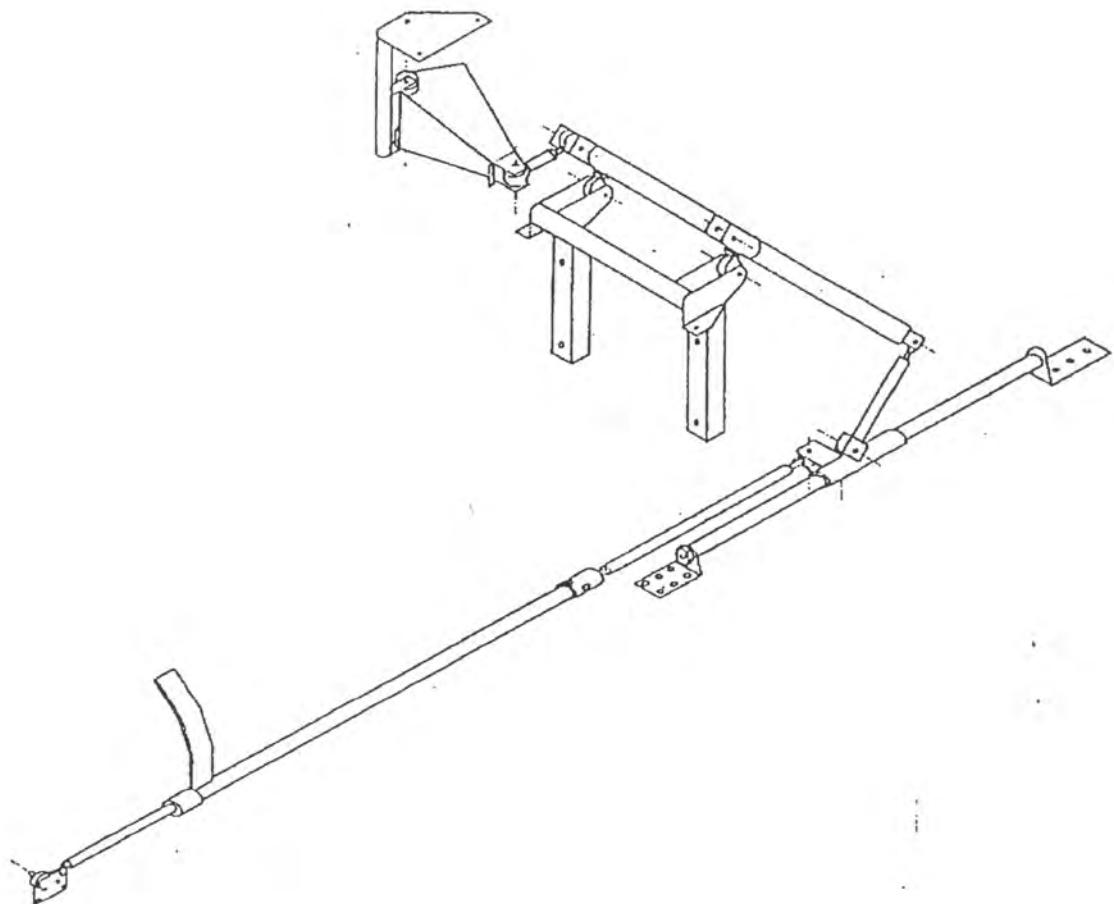

LANDING GEAR

Sprung and retractable, housed in a closed box, right hand operation. Tail skid including cable deflector or tail wheel optional.

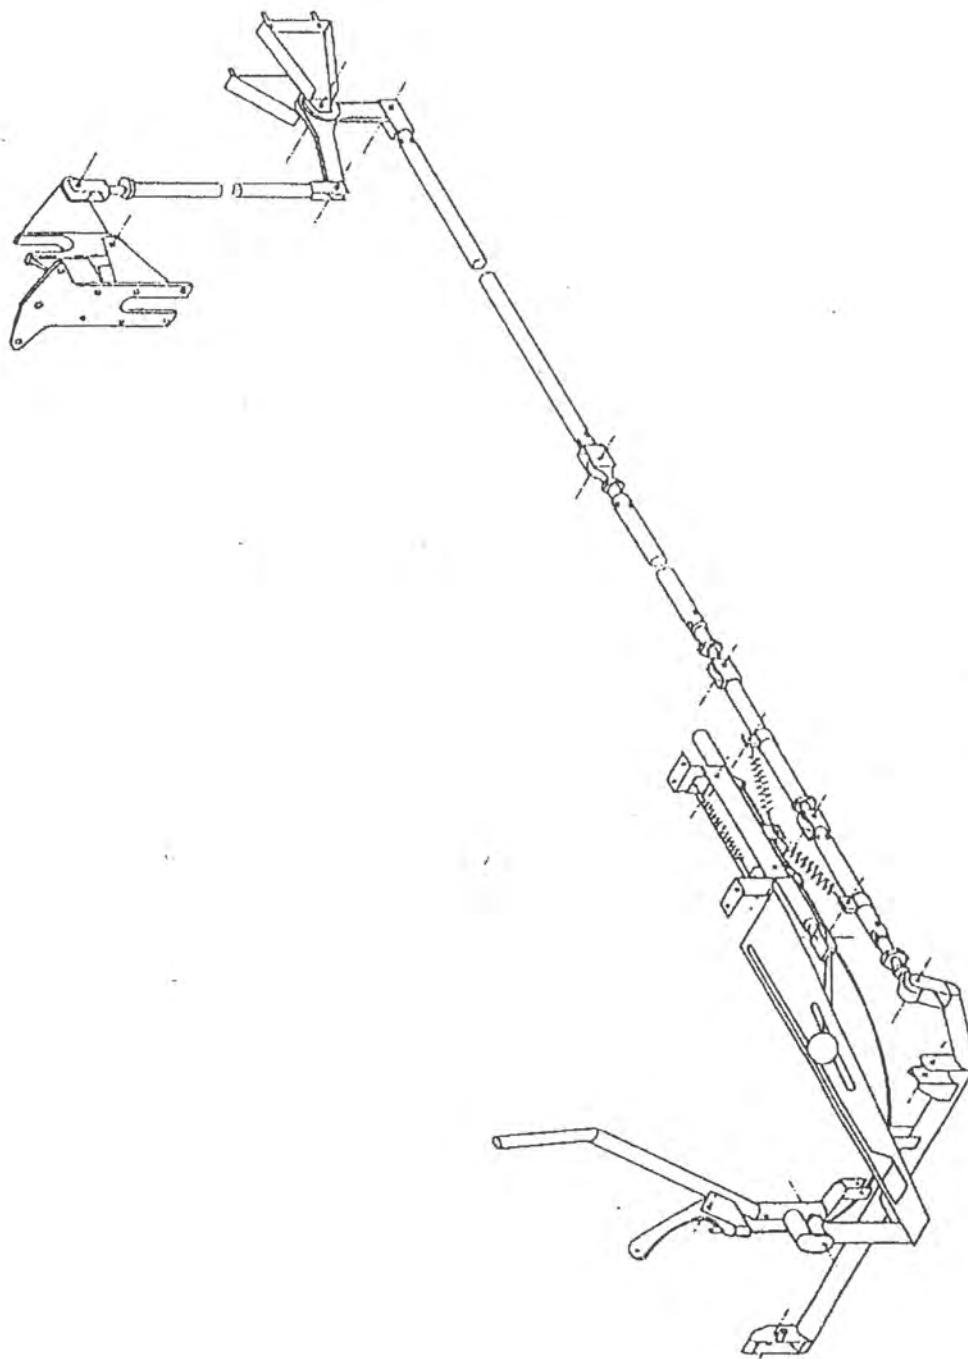

AILERON SYSTEM (Fuselage)

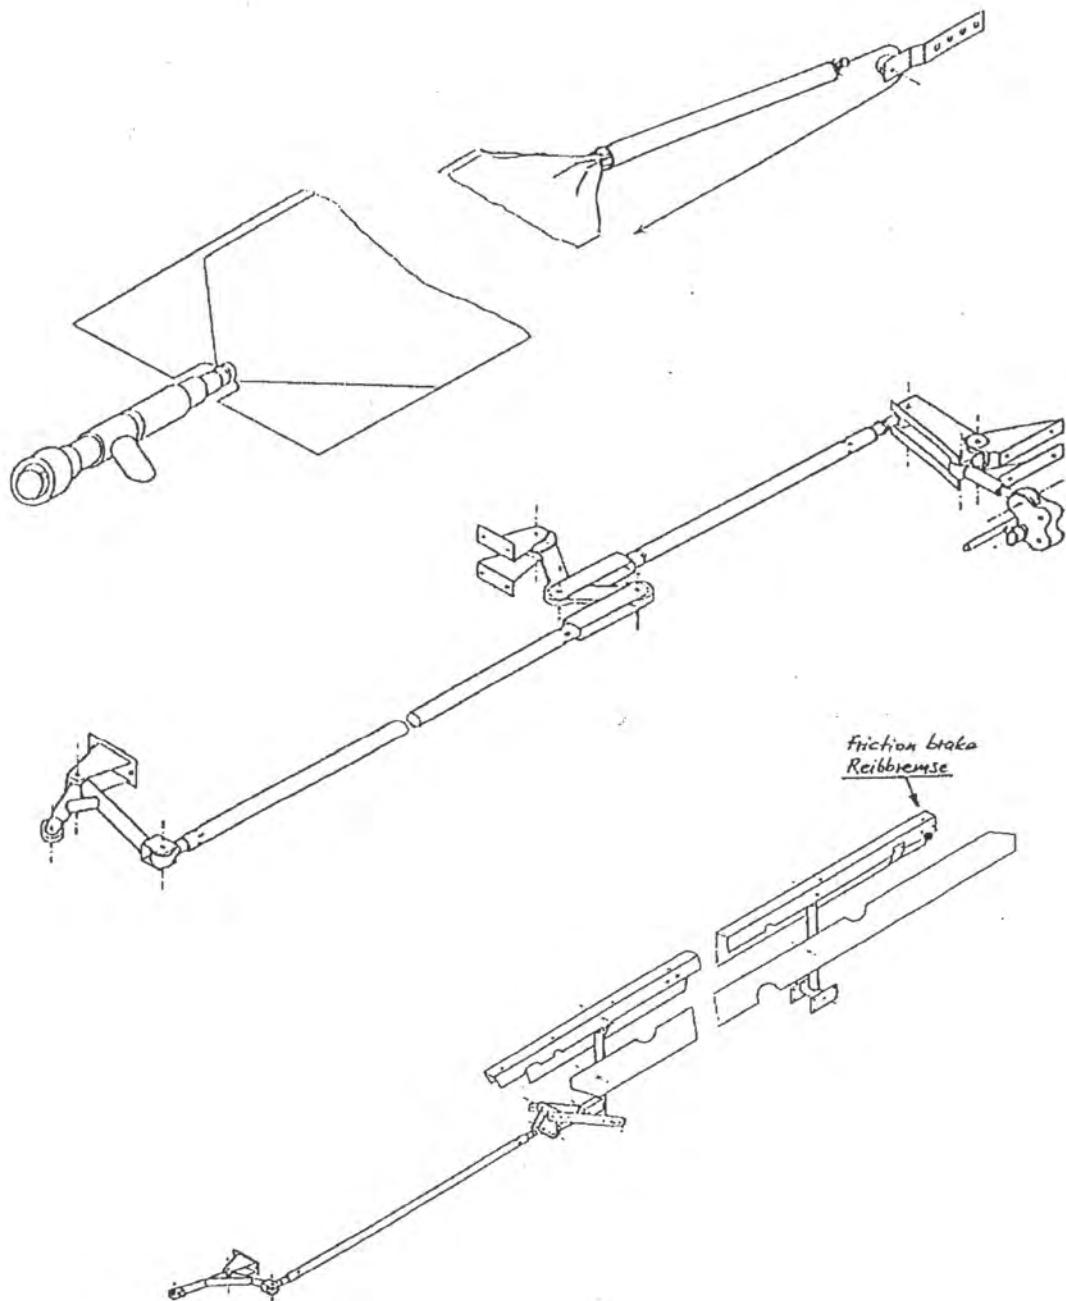

AIR BRAKE SYSTEM (Fuselage)

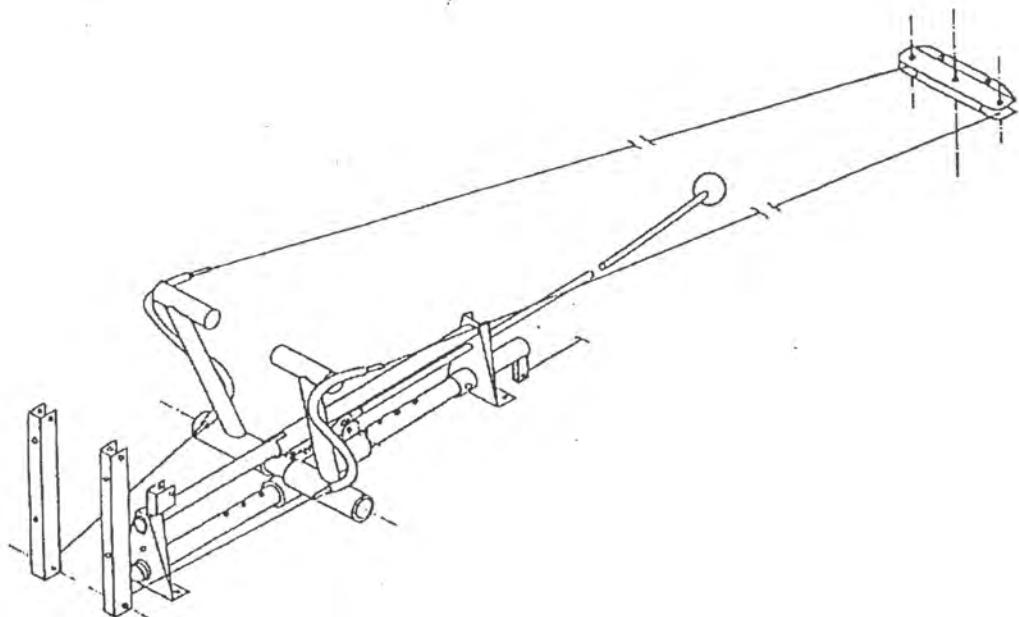

ELEVATOR SYSTEM

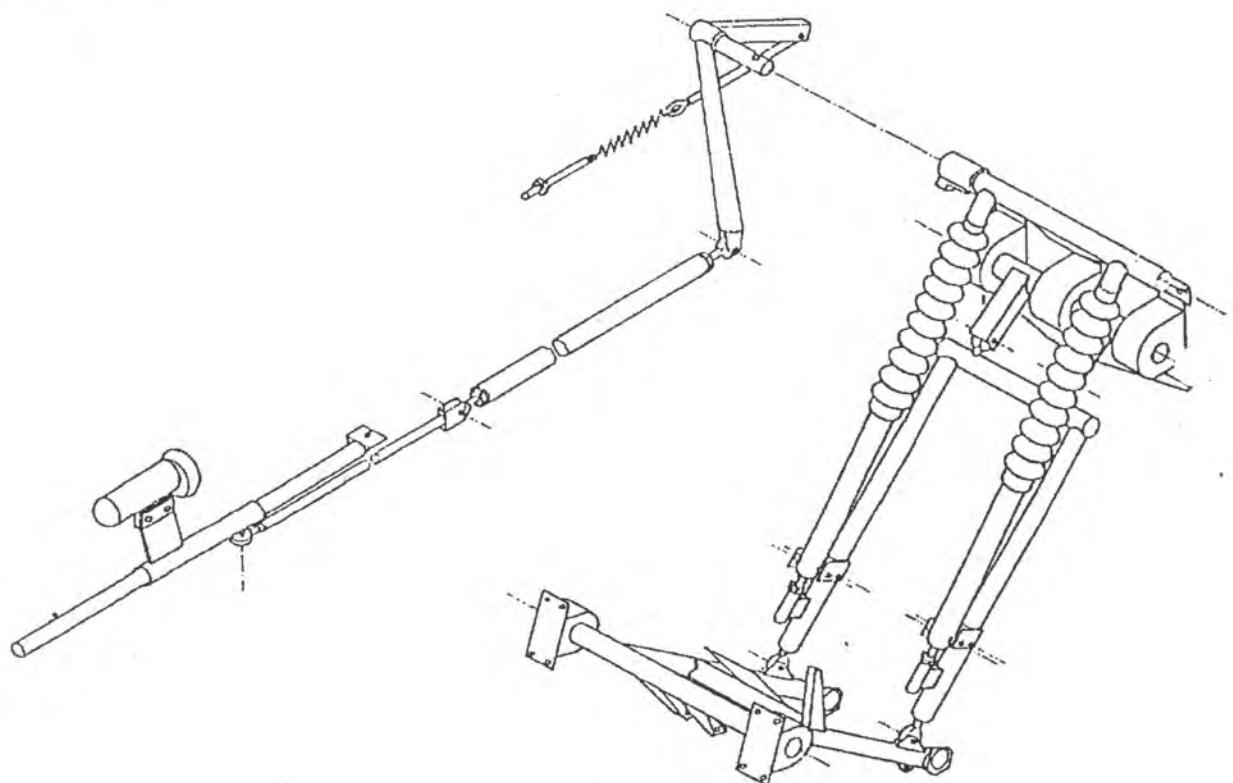

WING CONTROL SYSTEMS AND WATER BALLAST SYSTEM

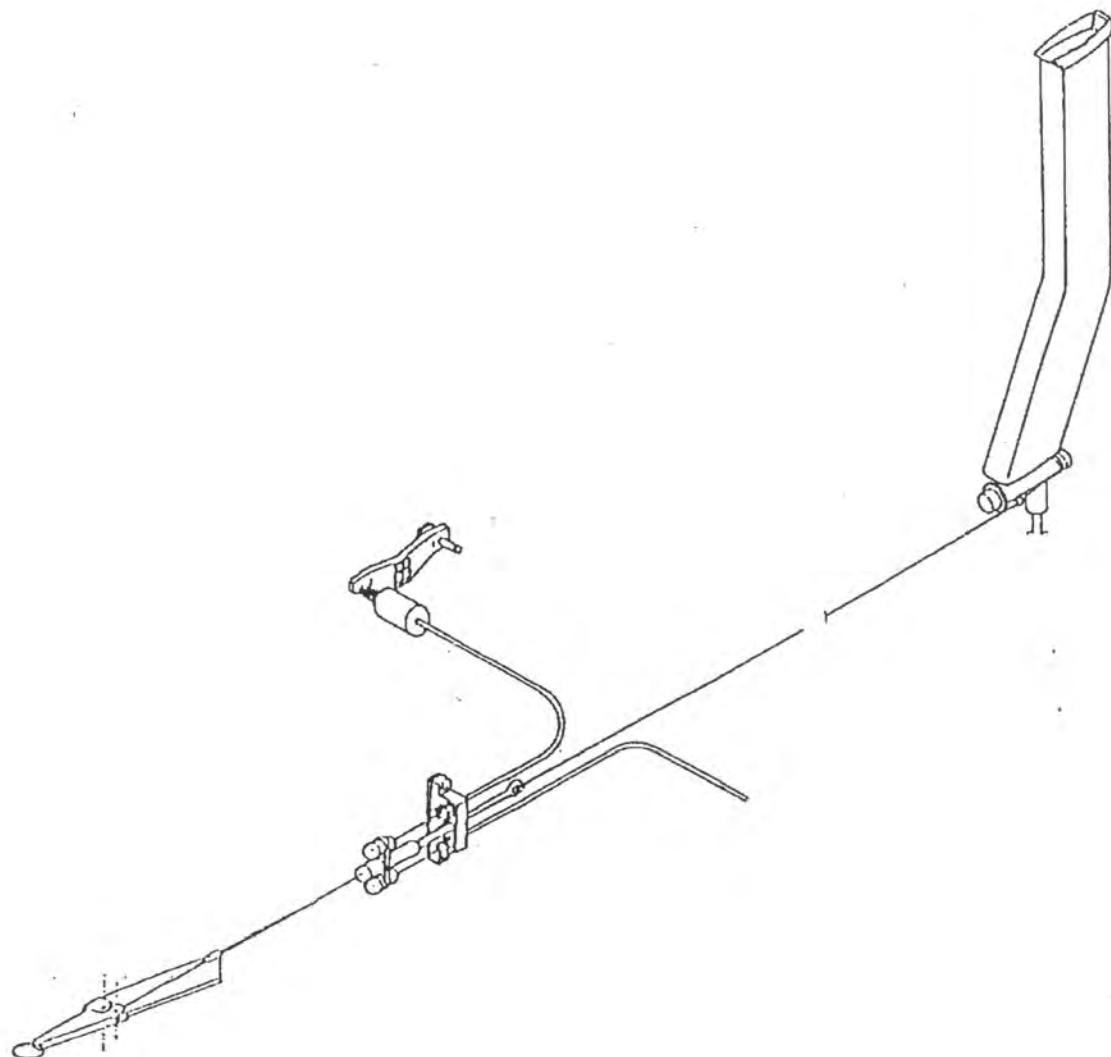

RUDDER CONTROL SYSTEM

LANDING GEAR SYSTEM

WATER BALLAST SYSTEM Fuselage

2.1 INTRODUCTION

This section describes the procedures for establishing the basic empty mass and C.G. position of the sailplane, procedures for determining permissible Cockpit Loading and approved mass limitations.

Complying with these procedures, the pilot is able to load the sailplane properly without any additional calculations due to loading limits placarded in the cockpit and provided in the Flight Manual page 6-2.

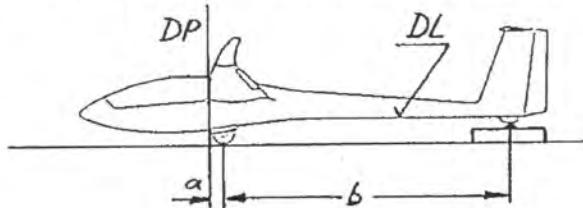

A comprehensive list of all equipment available for this sailplane is included in chapter 12.

2.2 WEIGHING PROCEDURE

DATUM LINE <DL>: Under side of fuselage boom placed horizontal

DATUM POINT <DP>: Leading edge of wing at root

1. Determine total weight by weighing all parts and adding together. For inflight C.G. position, the pilot's weight must be added too.
2. Assemble sailplane. For inflight C.G., the pilot must be seated in the sailplane.
3. Raise tail on weighing machine until datum line is level using wooden blocks or adjustable jack. (Check with leveling gauge)
4. Measure distance <b> from tail support to centre of landing gear axis.
5. Using plumb lead, determine points on floor perpendicular to left and right datum points, and points on floor perpendicular to centre of landing gear axis. Measure distance <a> from wheel axis to datum point.

6. Determine tail weight and deduct weight of auxiliary support used under 3) to get net tail weight.
7. Calculate C.G. position for full vertical tail fin tank:

$$X_{CG} = \frac{(\text{net tail weight} + \text{tail fin water weight}) * b}{\text{empty weight} + \text{tail fin water weight}} + a$$

Calculate empty weight C.G. position for empty vertical tail fin tank:

$$X_{CG} = \frac{\text{net tail weight} * b}{\text{empty weight}} + a$$

8. When a battery is fitted in the vertical tail fin, weighing must be done in this configuration. Weigh tail fin battery separately. (Maximum 2.6 kg (5.7 lbs)).
9. Calculate loading limits according to page 2-2.

Form for Weighing Report see Maintenance Manual, page 14-4

### 2.3 CALCULATION OF LOADING LIMITS

1. Determine Minimum Cockpit Load for full and empty tail fin ballast tank following procedure given on page 2-1 from Table "Empty Weight C.G. Position", page 2-6 (kg/mm) or 2-7 (in/lbs).

When being used in a club, Minimum Cockpit Load should be 70 kg (154 lbs) for empty or non-existent tail fin tank. If it is higher, permanent ballast may be fitted under the forward seat portion, see page 11-1.

Finally, resulting Minimum Cockpit Load for full tail fin tank should be entered in the following places:

- 1) in weighing report of inspection
- 2) in Flight Manual page 6-2 in full tail fin tank column
- 3) under instrument panel cover
- 4) on Data Placard in cockpit

2. For existing tail fin tank, enter Minimum Cockpit Load for empty tail fin tank into Flight Manual page 6-2, column tail fin tank empty.

3. Maximum approved Weight of Non-lifting Parts may vary between 235 kg and 249 kg (518 lbs to 549 lbs).

In contrast to methods used up to now, Maximum Weight of Non-lifting Parts can be determined in relation to Empty Weight and Empty Weight C.G. Position according to table on page 2-4 and 2-5. See also examples on page 2-3.

Maximum Weight of Non-lifting Parts should be entered into Weighing Report.

4. Determine Maximum approved Cockpit Load from table "Empty Weight C.G. Position", pages 2-8 or 2-9.

Maximum Cockpit Load normally should be 110 kg (242 lbs), as given in empty weight C.G. table, when being used in a club. The range may be shifted to heavy pilots (for example 80-120 kg, (176-265 lks)) or to light pilots (for example 60-100 kg (132-220 lbs)) by installation of permanent trim ballast. It may be lower due to trim conditions, excessive equipment or repairs.

Calculate Maximum Cockpit Load on weighing report, see also examples on page 2-3.

Resulting Maximum Cockpit Load should be entered in the following places:

- 1) in weighing report of inspection
- 2) in Flight Manual, page 6-2
- 3) on Data Placard in cockpit

5. Empty weight (perhaps increased by weight of permanently fitted trim ballast) should be entered in the following places:

- 1) in weighing report of inspection
- 2) in Flight Manual, page 6-2 for calculation of maximum permissible water ballast weight

6. Battery position during weighing should be entered in the following places:

- 1) in equipment list and weighing report of inspection
- 2) on Data Placard in cockpit
- 3) in Flight Manual, page 6-2, if fitted in tail fin

For permanent installation of trim ballast weights see page 11-1.

## 2.3 CALCULATION OF LOADING LIMITS continued

EXAMPLE for calculation of loading limits:

See also Maintenance Manual page 14-4, form Weighing Report

Maximum all-up weight ..... 486 kg &lt;1071 lbs&gt;

	Example 1	Example 2	Example 3
<b>1) Minimum Cockpit Load</b>			
For empty weight of and empty weight C.G.position the Minimum Cockpit Load according to table pages 2-6/7 is	244 kg/538 lbs 677 mm/26.65 in	244 kg/538 lbs 659 mm/25.94 in	250 kg/551 lbs 618 mm/24.33 in
Limit value greater than calculated value	75 kg/165 lbs ..679mm/26.73in	70 kg/154 lbs ..661mm/26.02in	60 kg/132 lbs ..620mm/24.41in
	677 mm/26.65 in	659 mm/25.94 in	618 mm/24.33 in
<b>2) Maximum Weight of Non-lifting Parts</b>			
Maximum weight of non-lifting parts at empty weight of and empty weight C.G.position is according to table pages 2-4/5	244 kg/538 lbs 677 mm/26.65 in	244 kg/538 lbs 659 mm/25.94 in	250 kg/551 lbs 618 mm/24.33 in
	241 kg/531 lbs	239 kg/527 lbs	238 kg/525 lbs
<b>3) Maximum permissible Cockpit Load</b>			
For empty weight of and empty weight C.G.position maximum permissible cockpit load is according to table pages 2-8/9	244 kg/538 lbs 677 mm/26.65 in	244 kg/538 lbs 659 mm/25.94 in	250 kg/551 lbs 618 mm/24.33 in
Limit value smaller than calculated value	120 kg/265 lbs ..675mm/25.57in	110 kg/242 lbs ..646mm/25.43in	100 kg/220 lbs ..606mm/23.86in
	677 mm/26.65 in	659 mm/25.94 in	618 mm/24.33 in
<b>4) Limitation of maximum permissible Cockpit Load</b>			
FUSELAGE with complete equipment, battery, canopy and main pins ....	119.9 kg/264lbs	119.9 kg/264lbs	124.9 kg/275 lbs
HORIZONTAL TAIL UNIT .....	6.3 kg/ 14lbs	6.3 kg/ 14lbs	6.3 kg/ 14 lbs
COCKPIT LOAD (Maximum 120kg/265lbs)	114 kg/251lbs	110 kg/242lbs	100 kg/220 lbs
Weight of Non-lifting Parts .....	236.2 kg/521lbs	236.2 kg/521lbs	231.2 kg/510 lbs
<b>MAXIMUM COCKPIT LOAD</b> (Max. 120 kg/ 265 lbs) .....	114 kg/251lbs	110 kg/242lbs	100 kg/220 lbs

At example 1 maximum cockpit load is limited by maximum weight of non-lifting parts.

Example 2 results from equipment being shifted forward: Cockpit load range 70-116 kg <154-242 lbs>, limitation of maximum cockpit load by C.G. table (with a heavier pilot, the forward inflight C.G. limit would be exceeded).

Installation of further equipment at the forward fuselage (for example: nose hook system and instrumentation) results in example 3: Cockpit load range 60-100 kg <132-220 lbs>.

## 2.4 CALCULATION OF MAXIMUM WEIGHT OF NON-LIFTING PARTS

Maximum weight of non-lifting parts of 249 kg (549 lbs) must be reduced in relation to empty weight and empty weight C.G. position according to table below. (For lbs / inch values see following page)

Example: For empty weight C.G. position of 649 mm (25.55 in) and empty weight of 249 kg (549 lbs) the permissible weight of non-lifting parts is 240 kg (529 lbs).

Empty Weight G (kg) from-to	Empty weight C.G. Position Xs (mm)											
	from 540 to 559	from 560 to 579	from 580 to 599	from 600 to 619	from 620 to 639	from 640 to 659	from 660 to 679	from 680 to 699	from 700 to 719	from 720 to 739	from 740 to 759	
230-231	235	235	235	236	237	238	239	240	241	242	243	
231-232	235	235	235	236	237	238	239	240	241	242	244

## 2.4 CALCULATION OF MAXIMUM WEIGHT OF NON-LIFTING PARTS continued

Maximum weight of non-lifting parts of 549 lbs (249 kg) must be reduced in relation to empty weight and empty weight C.G. position according to table below. (For kg / mm values see preceding page)

Example: For empty weight C.G. position of 25.55 in (649 mm) and empty weight of 549 lbs (249 kg) the permissible weight of non-lifting parts is 529 lbs (240 kg).

Empty Weight G(lbs) from-to	Empty weight C.G. Position Xs (inches)											
	from 21.26 to 22.01	from 22.02 to 22.80	from 22.81 to 23.58	from 23.59 to 24.37	from 24.38 to 25.16	from 25.17 to 25.95	from 25.98 to 26.73	from 26.77 to 27.52	from 27.53 to 28.31	from 28.32 to 29.09	from 29.13 to 29.88	
507-509	518	518	518	520	522	525	527	529	531	534	536

For values beyond the printed table - contact manufacturer

3.1 ORDINARY INSPECTIONS

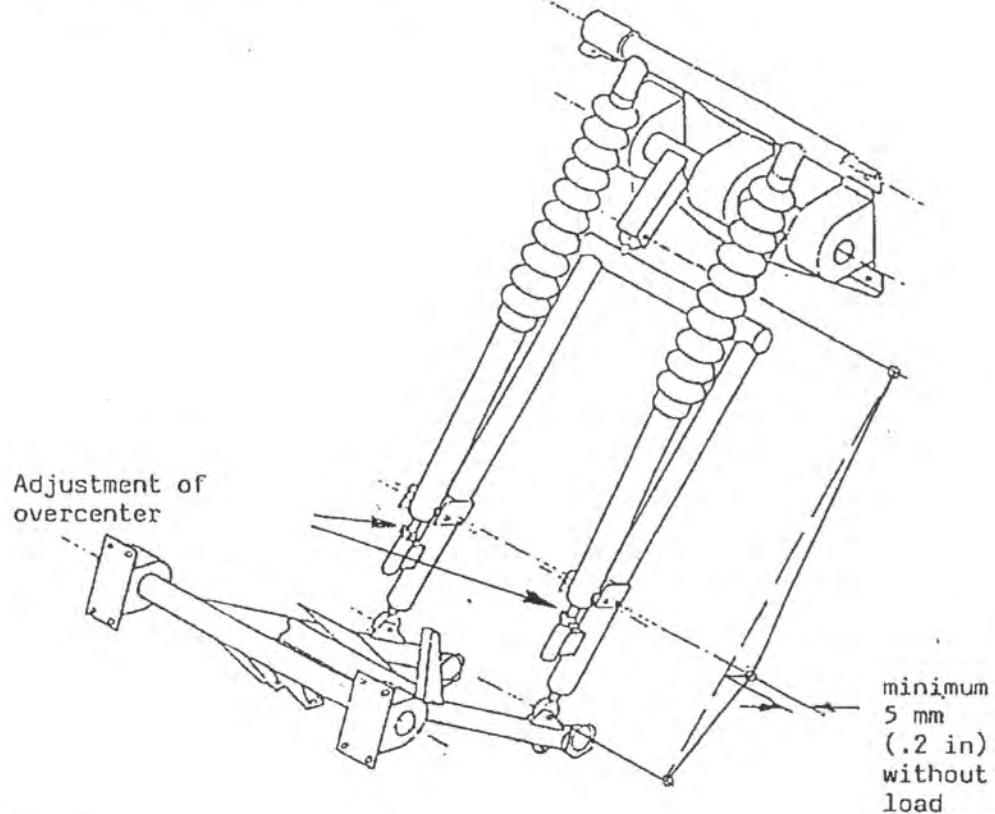

DAILY INSPECTION and PREFLIGHT CHECK see Flight Manual pages 4-3 / 4-4.  
POSTFLIGHT CHECK see Flight Manual page 4-16.

ANNUAL INSPECTION

1. Check wing shell, especially in the spar region, for:
  - \* cracks, scratches, pressure marks
    - shell and spar caps are made from carbon fiber material. This is sensitive against impact and compression, damage is difficult to detect.
    - \* When suspecting damage, tap region off.
    - \* Compare wing bending frequency number with earlier measured values or with final production inspection value.
2. The aileron sandwich is pressure sensitive.
  - \* When pressure marks are present,
    - then the sailplane may be no longer airworthy.
    - Because of resulting possible danger of flutter, contact manufacturer for damage classification and repair.
3. Fuselage automatic aileron connectors are equipped with deflectors to avoid incorrect rigging.
  - \* Check if rigging of the second wing is impossible with
    - intentionally incorrect aileron deflection (aileron neutral or deflected upward).
4. Lubricate various parts according to plan ( see page 3-4)
5. Protect gelcoat with car polish
  - \* See also Flight Manual pages 8-4/8-5, Cleaning and Care.
  - \* This wax film protects gelcoat against embrittlement and cracking due to ultra violet light.
  - \* If you use a polishing machine, be careful not to damage
    - sealing
    - anti-collision colour markings
    - registration signs (these synthetic resin varnishes are temperature sensitive).
6. Check anti-friction tape at aileron leading edge sealing ( normally plastic strip seals, on the underside sometimes metal strip seals).
  - \* Damaged anti-friction tape will yield damage of gelcoat at control surface very quickly.
  - \* For installation of sealing see pages 4-3 to 4-5.
  - \* Remove residual adhesive using lead-free petrol, see also Flight Manual page 8-5, Cleaning and Care.
7. Check air brake friction damper at outer side of air brake box for proper operation of damper rod and pads free from grease.
8. Check landing gear for
  - \* overcenter of folding strut:
    - Adjustable overcenter should be 5 mm ( $\varnothing$ .2 in), gear without load (For adjustments see also sketch on following page)
    - Value increases with load.
  - \* preset load at overcenter
  - \* rubber torsion elements for deformation or separation of rubber from metal.
  - \* When adjustments are being made, check for
    - identical overcenter at both folding struts
    - locking of adjusters.

3.1 ORDINARY INSPECTIONS continued  
ANNUAL INSPECTION continued

Landing gear overcenter adjustment

9. Perform Annual Inspection according to checklist, chapter 14.  
The annual inspection checklist contains items (aileron lateral bearing play, aileron vent holes), which may only be checked after removing seals. Unless changes are suspected (for instance lateral control surface gaps differing from design values, see also page 4-1), it is illogical to remove (destroy) seals just for inspection purpose. Existence of washer at fixed bearings can be checked after lifting sealing lids cautiously.
10. Dismantle water ballast bags and vertical tail fin tank (if existent) and check for function (for instance chafe marks, tightness etc.) Wire meshing at tail fin tank upper end and in filling funnel are mandatory to establish proper function of vertical tail fin valve.
11. Check thermometer zero indication using water with ice-water mixture (Exist only when equipped with tail fin tank).
12. When equipment has been altered compared to valid equipment list, file new equipment list and redetermine C.G. (See chapter 2). With equipment unaltered, C.G. should be redetermined every four years.  
Appropriate forms see chapter 14.

3.1 ORDINARY INSPECTIONS continued  
ANNUAL INSPECTION continued

13. Check function of canopy emergency release

Measure force required for canopy emergency release according to following procedure (When this measurement or a release test is being performed without a helper, the spring of the canopy jettison rear edge temporary bolt becomes distorted and must be exchanged):

- "Pilot" with appropriate dynamometer in cockpit
- both canopy openers in open position
- helper at front canopy end to avoid gas spring to lift unit upward
- maximum force for emergency release 15 kg (33 lbs)
- after force measurement: the "pilot" pushes the rear end temporary hinge bolt free and lifts canopy at opening levers, the helper holds the front end on the connector. When in fully open position, the helper pushes the connection pin upward and engages canopy to opener by turning driving lug.

\* If emergency release force is too high, all moving parts should be greased. In doubt contact manufacturer.

14. Check function of canopy jettison rear edge temporary hinge bolt. Measure force required to pull bolt free from spring during opening of canopy at rear canopy edge: force should be between 8 and 15 kg (18 to 33 lbs). When force is clearly lower, the spring must be exchanged to guarantee proper separation of canopy from fuselage during jettison.

3.2 EXTRAORDINARY INSPECTIONS

Extraordinary inspections should be performed, depending on circumstances (rough landings, ground loops etc.)

1. Landing gear functioning, attachment and drive
2. Landing gear box for damage
3. Tail skid bonding or tail wheel attachment
4. Wings, fuselage and tail for damage (cracks, buckling, compression)
5. Wing's flex number (support fuselage in front of landing gear)
6. Control surfaces function and deflections
7. Tangential tubes across fuselage for straightness

3.3 LUBRICATION SCHEDULE

Location	Frequency	Lubricant
Main pins and matching holes	Before assembly	Water insoluble bearing grease or grease containing molybdenum, for instance: Molykote BR2 (Temperature range from -30°C to 130°C, -22°F to 266°F)
Pins and matching holes of elevator connections		
Wing side bearings at automatic aileron and air brake system connectors, which are inserted into fuselage couplings		
Landing gear: all joints at rubber bearings	Once a year	Oil
Landing gear, all metal parts		Spray oil (for instance: Caramba) Note: Protect rubber parts against oil
Bearings of control surfaces	after dis-assembly only	Molykote grease BR2 (Temperature range from -30°C to 130°C, -22°F to 266°F) or Molykote grease 33 (Temperature range from -70°C to 180°C, -94°F to 356°F)

**IMPORTANT NOTE:** NEVER grease LONGITUDINAL MOTION PUSHROD BEARINGS, they will be destroyed soon due to collection of small foreign matter. These bearings are used in the elevator system, aileron system and air brake system.

**WARNING:** The friction dampers inside the airbrake boxes prevent oscillations during extension of airbrakes. Therefore, friction pads should never be greased or oiled !

**TOW RELEASE:** See Maintenance Instructions of manufacturer (Tost)

**MULTIPLE POINT BUCKLE**

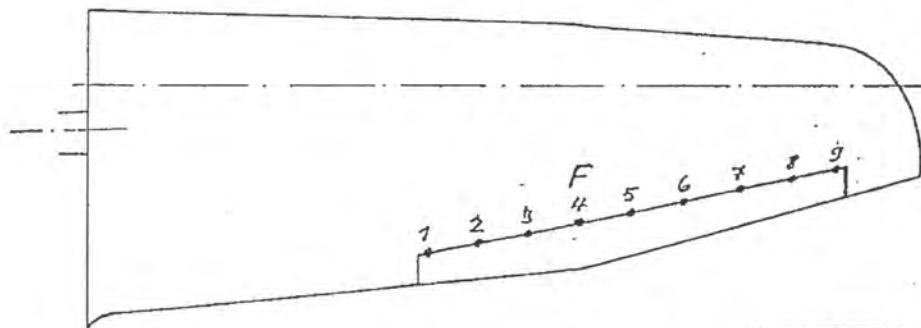

**of FAG-7H safety harness:** See Maintenance Instructions of manufacturer (Autoflug) <Excerpt see in Appendix>

4.1 INSTALLATION OF CONTROL SURFACES

WARNING: Nuts according to specification LN 9348 may be replaced by nuts according to specification DIN 6924 (985) - M..-8 (the dots represent the nominal thread diameter). The -8 code on each nut indicates the category of strength. If this code is not existent, the nut complies to a lower category of strength and is unsuitable for this use !

DISASSEMBLY OF AILERONS

Wing scheme with aileron bearings, F= laterally fixed bearing

- remove seal (convex plastic strip) from upper aileron side at outer aileron edge
- remove fillet on outside upper edge of aileron near bearing No. 9 .
- turn wing upside down, remove under side gap seal (convex plastic strip) and Teflon strip completely
- disconnect drive rods from aileron (6mm thread, nut LN 9348, bolt LN 9037, width over flats 10 mm), remember sequence and position of washers, if applicable.
- loosen nut (6 mm thread, LN 9348, width over flats 10 mm) from bearing No. 4, (fixed bearing) remember sequence and position of washers.
- deflect aileron fully downward and remove it from bearing pins towards wingtip. Use two persons to avoid damage!
- watch washers, if existent, at inner side of bearing pin No. 4 .

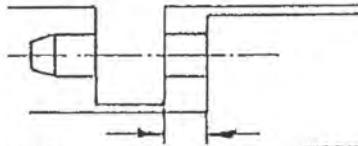

ASSEMBLY OF AILERONS

- grease bearings according to Lubrication Schedule, page 3-4.
- make sure that washers, if existent, are on inner side of fixed bearing pin, No. 4
- match aileron pins with bearings, when aileron fully deflected downward. Use 2 persons. Do not use force. Set up washers at bearing No. 4 as found during disassembly.

4.1 INSTALLATION OF CONTROL SURFACES continued

ASSEMBLY OF AILERONS continued

- tighten nut (6 mm thread, LN 9348, width over flats 10 mm) at bearing No. 2 with maximum torque 6.4 Nm (0.64 mkg, 4.623 ft lbs).
- check lateral bearing play:  
minimum of 3 mm (0.12 in)

- check lateral aileron gaps:  
at tip minimum of 2 mm (0.08 in)  
at inner edge minimum of 1 mm (0.04 in)
- fix drive rod to aileron drive using bolt (LN 9037), nut (LN 9348) and washers, if applicable (6 mm thread, LN 9348, width over flats 10 mm). Maximum torque 6.4 Nm (0.64 mkg, 4.623 ft lbs).
- bond fillet flush into outer edge cutout, check unobstructed movement.
- restore gap seals locally or completely, see page 4-4 for details.

DISASSEMBLY OF ELEVATOR

- remove bearings and washers at elevator drive, remember sequence and position of washers (Width over flats 10 mm).
- remove elevator halves towards center.
- watch washers, if existent, at inner side of both inner bearing pins.

ASSEMBLY OF ELEVATOR

- grease bearings according to Lubrication Schedule, page 3-4.
- make sure that washers, if existent, are on inner side of inner bearing pins.
- match elevator halves pins with bearings, do not use force.
- minimum outer lateral elevator gap 1 mm (0.04 in), when inner bearings just touch shoulders.
- install both drive bearings with washers as found during disassembly (0.1 mm <0.04 in> shim between bearings), bolt (LN 9037) and nut (LN 9348). Maximum torque 6.4 Nm (0.64 mkg, 4.623 ft lbs).
- do not brace elevator halves against inner bearings, maximum axial play 0.5 mm (0.02 in)
- install plastic strip gap seal, see page 4-4 for details.

**4.1 INSTALLATION OF CONTROL SURFACES** continued**DISASSEMBLY OF RUDDER**

- disconnect rudder cables, watch spacing casing.
- loosen nut at lower bearing (6 mm thread, LN 9348, width over flats 10 mm) using a socket wrench, remember sequence and position of washers.
- lift rudder upward from bearings.

**ASSEMBLY OF RUDDER**

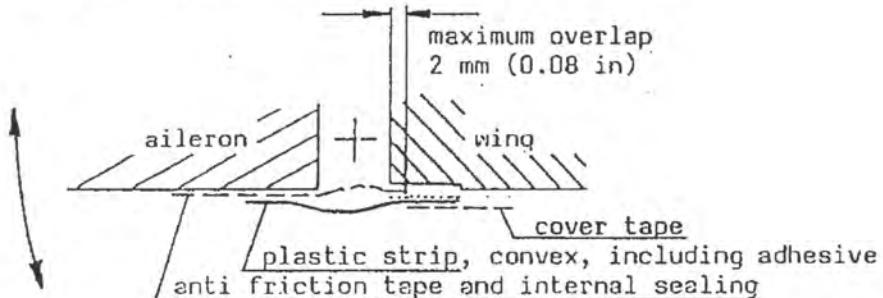

- grease bearings according to Lubrication Schedule, page 3-4.
- set rudder into bearings, do not use force!
- set up washers at lower bearing as found during disassembly (normally: recessed washer first, then large washer). Tighten nut (6 mm thread, LN 9348, width over flats 10 mm) with maximum torque 6.4 Nm (0.64 mkg, 4.623 ft lbs). After assembly the rudder should have slight axial play. Maximum play is 1 mm (0.04 in).
- connect rudder cables, do not forget to insert spacing casings.
- if necessary, restore gap seals (convex plastic strip), see page 4-4 for details.
- check pedal-rudder alignment: with pedals in neutral position and rudder deflected to one side, twist opposite cable clockwise (maximum 5 turns) until properly aligned.  
Should more than 5 turns be necessary for alignment, exchange cables. Never turn cables counter clockwise!
- Tighten nuts at rudder cable connection (6 mm thread, LN 9348, width over flats 10 mm) with maximum torque 6.4 Nm (0.64 mkg, 4.623 ft lbs).

**CAUTION:** In case of repairs, never pull longitudinal motion control system pushrods out of their bearings, all balls will leave their cages. Subsequently a hole near each bearing is necessary to reinstall them.

Longitudinal motion ball bearings are used throughout the wing control systems and in the fuselage elevator, aileron and landing gear systems.

#### 4.2 INSTALLATION OF UNDER SIDE GAP SEALING

1. Lay wing upside down on adequately padded supports at root rib and wingtip, outside of aileron, see also sketch below.  
Tighten plastic gap seal during bonding always with 2 persons.

2. Clean bonding area from adhesive residues, if bonding area is milled (no or almost no white gelcoat existent) prime with contact adhesive (Example: Pattex).
3. Deflect aileron fully downward, mark rear edge of seal on aileron using a short length of seal and soft pencil.
4. Deflect aileron fully upward, place self-adhesive Teflon tape with its rear edge 2 mm <0.08 in> behind marking of seal's rear edge.
5. Cut Teflon tape leading edge using a sharp knife such, that bonding width on wing is 2 mm <0.08 in>. When Teflon tape bonding width on wing is wider, bonding width for convex plastic seal is insufficient because Teflon prevents proper bonding.
6. Remove masking tape from convex plastic seal and position leading edge flush with wing side cutout.
7. Cover leading edge of convex plastic seal with tape against warping (Example: Tescal 4178 white).

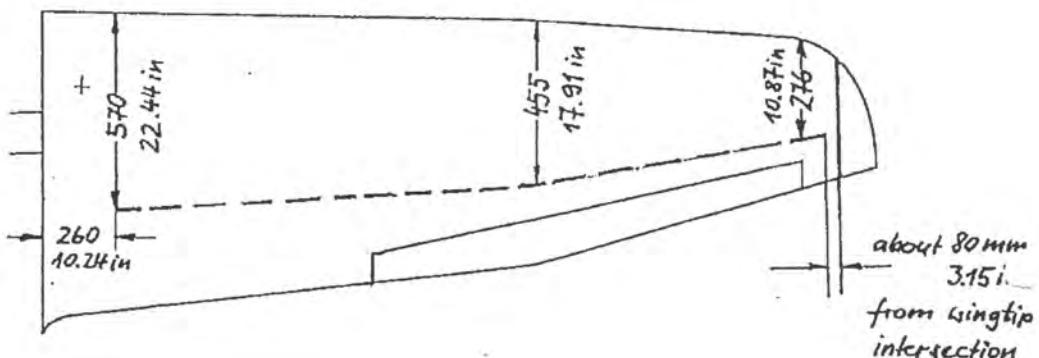

#### 4.3 INSTALLATION OF UPPER SIDE GAP SEALING for aileron, elevator and rudder

1. Clean bonding area from adhesive residues
2. Deflect control surface fully towards sealing, mark rear edge of seal on control surface using a short length of seal and soft pencil.
3. Bond PTFE-anti friction tape (20 mm <0.79 in> wide, translucent) with its rear edge 2 mm <0.08 in> behind marking of seal's rear edge.
4. Remove masking tape from convex plastic seal and position leading edge flush with either wing side cutout or with full bonding width on fin.
5. Cover leading edge of convex plastic seal with tape against warping (Example: Tescal 4178 white).

**4.4 INSTALLATION OF TURBULATOR TAPE ON WING UNDER SIDE**

Turbulator tape is of 60 Degree Zig Zag Type.

Given measurements are distances from leading edge of turbulator to leading edge of wing, values in mm and inches.

**4.5 SEAT****DISASSEMBLY**

- remove 4 countersunk screws, Phillips recess, at left side along air brake handles guide
- remove 6 bolts, hexagon recess No.5
- remove backrest cable guide tube from backrest clamps by pulling out and disconnect base from seat
- remove T-shaped handle from pedal adjuster cable (5 mm thread, nut LN 9348, width over flats 8 mm, use 8 mm socket wrench) and pull cable through seat guide tube.
- loosen stick cover, move air brake handle into forward position
- swivel left seat side up and take seat out to upper left, use elasticity of seat to direct left lap fixing bolt around elevator pushrod guide and seat support

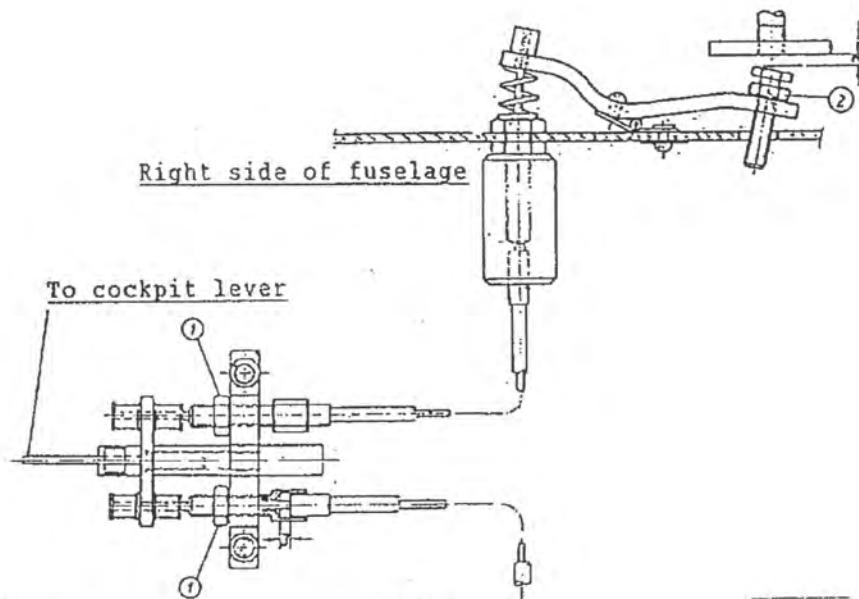

**ASSEMBLY**

Follow disassembly steps in reverse order, in addition observe the following:

- inspect seat area for foreign matter, tools etc.
- rest seat right side on support, direct control stick into cutout and pedal adjuster cable into guide, place air brake handle into forward position
- when lowering seat, watch especially for nut at left lap belt fixing point, this should never forced over the seat support and elevator pushrod guide
- if seat fixing bolts are different in length, the short one must be fitted behind trim indicator to avoid chafing at trim system or trim malfunction
- screw T-shaped handle to pedal adjuster cable and air brake handle guide into position
- check control system after installation for proper operation

**4.6 ADJUSTMENT OF WATER BALLAST VALVES (Vertical tail fin tank fitted)**

- check cockpit operating lever for overcenter in open position
- check bowden cable end play >1< at fuselage to wing mechanisms for nominal value of 3 mm <0.118 in>, when knurled nuts at drives inside baggage compartment are at clockwise stops
- check vertical tail fin tank opening after filling some water: nominal value 5 to 7 mm <0.197 to 0.276 in> travel at upper end of operating lever. If necessary, adjust at >2<.
- check play at >3< by pressing fuselage to wing mechanisms until touching wing valve stems for nominal value 3 mm <0.118 in>. If necessary, adjust at fuselage from outside
- do not forget to lock nuts after adjusting

**4.7 WATER BALLAST SYSTEM Disassembly and Assembly****WING WATER BALLAST BAGS**

Wing water bags are kept in straight position by nylon rope, running from bag end over a pulley to the root rib, tension approx. 10 kg (45 lbs).

**Disassembly**

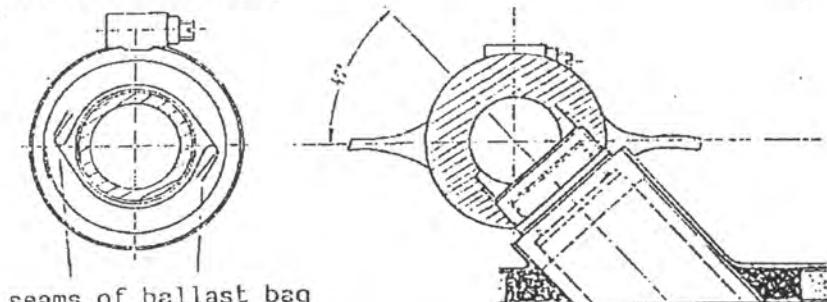

- using water valve key (standard equipment), disconnect screwed joint of valve with release tube from under side through release tube
- unscrew large PVC-nut at root rib
- open knot at rope end and connect approx. 15 m (49 ft) of braided nylon rope (ends heat sealed) by stitching for about 50 mm (2 in). Do not connect by knot, this will not pass through pulley guide
- if water bags are taken out of wings without additional rope, the wing shell must be cut open near the pulley to reinstall the rope !
- pull valve and bag through opening in root rib

**Assembly**

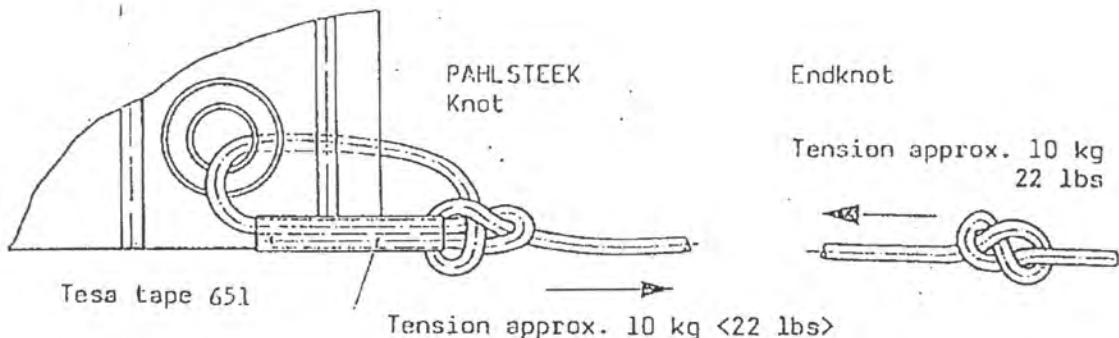

- pull bicycle type tube over valve end, 60 mm (2.4 in) long
- adjust ballast bag with seam to leading edge and to valve as shown below (different adjustment to valve increases discharge time considerably)
- push bag on valve stub, cover bag on stub with tape (example Tesaflex 4163) to protect bag against damage by hose clamps. Turn both seams during taping in the same circumferential direction, otherwise again considerable increase of discharge time.
- tighten hose clamps and check for water tightness before installation into wing
- connect braided nylon rope to brass eye at bag end by special knot ("Pahlsteek") as shown overleaf, cover free rope end by tape
- connect rope to intermediate rope in wing (if no longer connected) by stitching
- check existence of bonded-on gasket at valve discharge orifice

**Installation**

- Water bags are 75 Liter LS7 bags (according to drawing 1F5-35), reduced in length by 1 m (3.28 ft) according to drawing 1BF-92 by use of PVC tube. Without reduction water pressure during spinning damages wing structure. Installation of bags without length reduction is not approved!
- place bag with seam to leading edge and valve discharge orifice 45° downward to the trailing edge, roll bag and push into root rib cutout, pull cautiously at intermediate rope only
- screw valve to discharge tube from outside through tube using brass nut and water valve key
- screw PVC-nut to valve on outside of root rib by hand, no tools. This nut takes part of the tensional load from the discharge tube.
- pretension rope with about 10 kg (45 lbs), place end knot as shown overleaf. Fix rope end (about 0.5 m (20 in) long) at root rib, do not cut off
- check adjustment of water valves as outlined on preceding page
- fill bags according to instructions given in Flight Manual, check for tightness, proper discharge and discharge time
- when discharge time exceeds 4.5 minutes, the bag may possibly be twisted. When not tight - water dripping from one of the drain holes, the fault must be searched and cleared, this necessitates disassembly !

4.7 WATER BALLAST SYSTEM Disassembly and Assembly continued

TAIL FIN WATER BALLAST TANK

Disassembly

- disconnect operating cable from cockpit distributor at position >2<, see sketch on page 4-2 and extend with approx. 6 m <20 ft> of thin nylon cord
- loosen clamp (or cut bonding) at right lower rudder cutout, holding discharge tube, push stiff tube of approx. 7 to 8 mm < $\varnothing$ .28 to  $\varnothing$ .32 in> outside diameter and 1.5 m <5 ft> long into discharge tube
- dismount 2 bolts holding upper tank end (and horizontal tail bracket), 8mm thread, LN 9037, width over flats 13 mm.
- cut silicon rubber sealing at upper end cautiously with sharp knife
- pull tank upward, at the same time push auxiliary tube from lower end accordingly

Assembly

- before installation, check valve tightness with water, also tightness with valve fully open, but discharge tube held closed. Valve travel about 9 mm <0.35 in>.
- push auxiliary tube into discharge tube, cover joint with tape to avoid edge catching at ribs or webs
- connect drive cable with auxiliary cord
- insert tank into vertical tail fin upper end, at the same time guide auxiliary tube and pull at cord from cockpit
- valve must be inserted into cutout in lower tail fin rib, use caution to avoid valve damage
- seal upper tank edge with silicon rubber to surrounding structure
- mount 2 bolts holding upper tank end (and horizontal tail bracket), 8mm thread, LN 9037, width over flats 13 mm. When the tank is combined with a battery box, these bolts also hold the battery box cover.
- clamp end of discharge tube (or fix by bonding) in right lower rudder cutout
- adjust valve operation as outlined on page 4-6

Check operation:

- a) watertight with valve closed
- b) opening before wing system opens
- c) tightness during filling (back to front via funnel). With valve open, water level in filling tube must remain constant.

**4.8 NOSE HOOK SYSTEM Disassembly and Assembly (Optional equipment)**

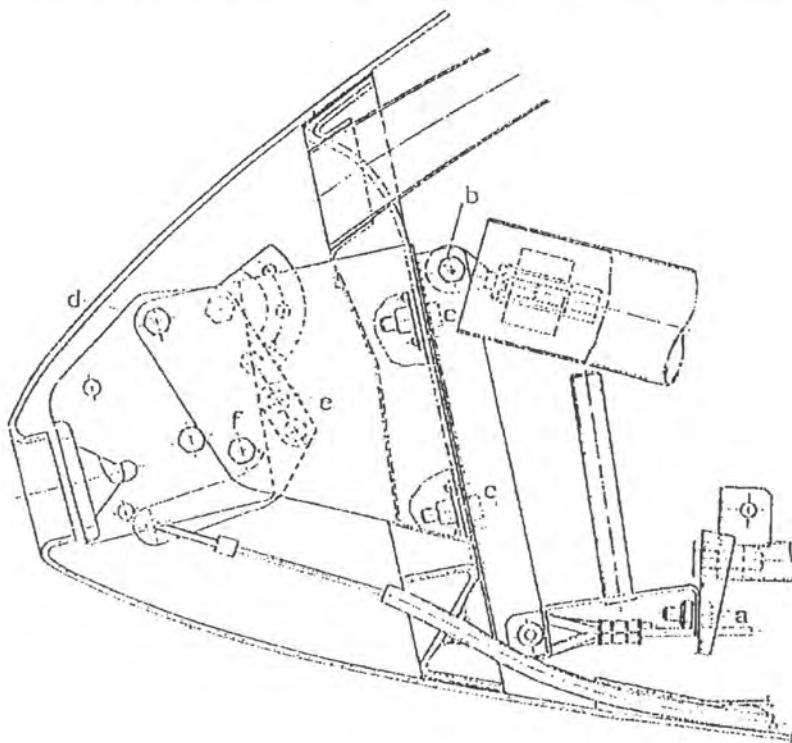

Tools: 3/4" drive ratchet, 8 and 10 mm sockets, 3 and 4 mm hex head driver  
sockets, 12 mm open end spanner, 10 mm ring spanner

General hint: Note length of bolts and positioning of washers for all assembly positions

- take canopy off fuselage with a helper after pulling emergency canopy release
- disassemble seat according to page 4-5
- under seat, disconnect C.G. release cable from pulley
- pull pedals to rearmost position
- disconnect trim weight holder from pedal guide >a<
- disconnect 2 bolts >b< at front end of canopy support from bracket, move support as far back into cockpit as possible, perhaps disconnect gas strut at one end as well
- disconnect both canopy support brackets from nose bulkhead >c< and move backwards too
- pull nose hook support backward from bulkhead
- disassemble nose hook from support >d<, watch for 4 spacers between nose hook case and support, at >f< 1 spacer inside nose hook case
- disassemble drive extension with cable at >e< from drive lever

ASSEMBLY of nose hook in reverse order, watch out especially for the following:

- insert spacer at >f< before assembly of drive lever extension
- when assembling nose hook into support, direct spacers into position using a 12 mm open ended wrench
- after assembly at >c< and connection of C.G. hook cable to pulley, check function of both hooks
- before installation of seat, check functions of pedal system and locking of pedal adjustment, function of canopy support, electrical and pneumatic installations of total instrumentation and check for foreign matter

### Airworthiness Limitations

1. Sailplane structural life limit:: **3000 hours** total flying time  
     The life limit may be increased according to  
     the procedure outlined on page 5-3 stepwise up to  
**12000 hours** total flying time.
2. Safety harness      Autoflug  
                             FAG-7H      lap belt with multiple point buckle  
                             shoulder strap  
                             (Lap belt with bracket 4R11-22a sewn in)  
**Webbing life limit 12 years from manufacturing date )\***
3. Safety harness      Gadringer  
                             Bagu 5303      lap belt with multiple point buckle  
                             Schugu 2700      shoulder strap  
                             (Lap belt with bracket 4R11-22a sewn in)  
**Webbing life limit 12 years from manufacturing date )\***

)\* See also Maintenance- and Operating Instructions of manufacturers.

Note:      Repair damage prior to next flight.

When in doubt, whether a "small repair" or a "major repair" is necessary, contact the manufacturer.

"Major repairs" must be accomplished in accordance with Rolladen-Schneider repair methods at national authorities-certified repair stations rated for composite aircraft structure work, at FAA Certificated Repair Stations, or by other qualified persons authorised to perform maintenance on composite structures.

Certain "major repairs" may only be performed by the manufacturer due to necessary jigs. This has to be checked with the manufacturer for the case in question.

### Inspection Sequence to Increase Service Life

#### 1. General

Results of supplementary serviceability tests at main spar booms for wings proved, that service life of FRP sailplanes may be increased to 12.000 hours if airworthiness of each single sailplane (in addition to annual inspections) is checked according to a special multi-step inspection programme.

#### 2. Schedule

When the sailplane has reached 3000 hours service life an inspection according to the programme mentioned under 3. Must be carried out. If the result of the inspection is positive or found defects repaired properly, the service life of this sailplane will be increased by 3000 hours to 6000 hours (1. Step).

The inspection routine should be repeated when reaching 6000 hours. With a positive result or found defects repaired properly, service life will be increased by another 3000 hours to 9000 hours (2. Step).

The inspection routine should be repeated when reaching 9000 hours. With a positive result or found defects repaired properly, service life will be increased by 1000 hours each to 10000 hours (3. Step), 11000 hours (4. Step) and 12000 hours (5. Step).

3. The valid **Inspection Programme** should be requested from the manufacturer stating serial number and service time.
4. Inspections should be carried out at the manufacturer or an adequately licences repair shop.
5. Results of inspections must be recorded in an inspection report, commenting to each inspection step. If inspections are not carried out at the manufacturer, a copy of the report must be sent to them for analysis.
6. This inspection does not affect annual inspections.

6.1 FLIGHT CONTROL TRAVEL LIMITS

<u>ELEVATOR:</u>	Up    28° to 30°
	Down 22° to 24°
<u>RUDDER:</u>	To both sides 26° to 30°
<u>AILERON:</u>	Up    21° to 25°
	Down 10° to 13°

For easier checking, measured angles may be converted to mm/in deflection values, using the actual local radius of the defined measuring place. See also table page 6-3 or deflections report of final production inspection.

6.2 CONTROL SURFACE WEIGHT AND MASS BALANCE

(Should be inspected when suspecting changes of mass / weight and after repairs)

Weight and mass balance should be within given limits for safety against flutter.

	Mass/Weight	Hor. Ref. Line	Hinge Moment
Elevator (*)	1.00 to 1.60 kg 2.21 to 3.53 lbs	Straight region of upper side	
Rudder	3.80 to 4.22 kg 8.38 to 9.30 lbs	Centerline of section	± 1.33 kgcm ± 18.47 in oz
Aileron	2.78 to 3.20 kg 6.13 to 7.06 lbs	Leading and trailing edges of under side connected	1.85 to 3.00 kgcm 25.69 to 41.66 in oz

(\*) Elevator hinge moment limits are not absolutely fixed, they are determined during final production inspection and then entered.

Measuring Technique for hinge moment:

Control surface should be attached to bearings without any tension or friction. Measure weight at rear edge with reference line level and local radius from hinge, multiply weight and radius to yield hinge moment. When using identical locations for measuring as used in final production inspection (see Control Surface Deflections inspection form, page 14-7), then rear edge weight only must be checked.

**Warning:** When during repairs local static moment is being changed, mass balance must be fixed in this region to yield identical static moment values as in original condition

6.3 CONTROL SURFACES PLAY AND FRICTION (Should be inspected annually)

	Play at inner rear edge	Friction
Elevator	maximum 2.4 mm <0.094 in>	maximum 100 grams <0.220 lbs>
Aileron <u>(*)</u>	maximum 2.4 mm <0.094 in>	200 to 500 grams <0.441 to 1.102 lbs>
Rudder	not applicable	up to 500 grams <1.102 lbs>

(\*) Aileron sealings on both upper and lower sides must be fitted !

Measuring Technique for rear edge play:

Play should be measured with control stick fixed to zero position.

Measuring Technique for friction:

Friction should be measured 30 mm <1.2 in> from top end of control stick for elevator and aileron. Values include seals.

Rudder friction should be measured at upper rudder edge.

6.4 LIMIT VALUES FOR CONTROL SURFACE DEFLECTIONS IN MM/INElevator

local radius mm/in	22° to 24°	28° to 30°
66 mm 2.598	25 to 27 mm 0.984 to 1.063	32 to 34 mm 1.260 to 1.339
67 mm 2.638	26 to 28 mm 1.024 to 1.102	32 to 35 mm 1.260 to 1.378
68 mm 2.677	26 to 28 mm 1.024 to 1.102	33 to 35 mm 1.299 to 1.378
69 mm 2.717	26 to 29 mm 1.024 to 1.142	33 to 36 mm 1.299 to 1.417
70 mm 2.756	27 to 29 mm 1.063 to 1.142	34 to 36 mm 1.339 to 1.417
71 mm 2.795	27 to 30 mm 1.063 to 1.181	34 to 37 mm 1.339 to 1.457
72 mm 2.835	27 to 30 mm 1.063 to 1.181	35 to 37 mm 1.378 to 1.457
73 mm 2.874	28 to 30 mm 1.102 to 1.181	35 to 38 mm 1.378 to 1.496

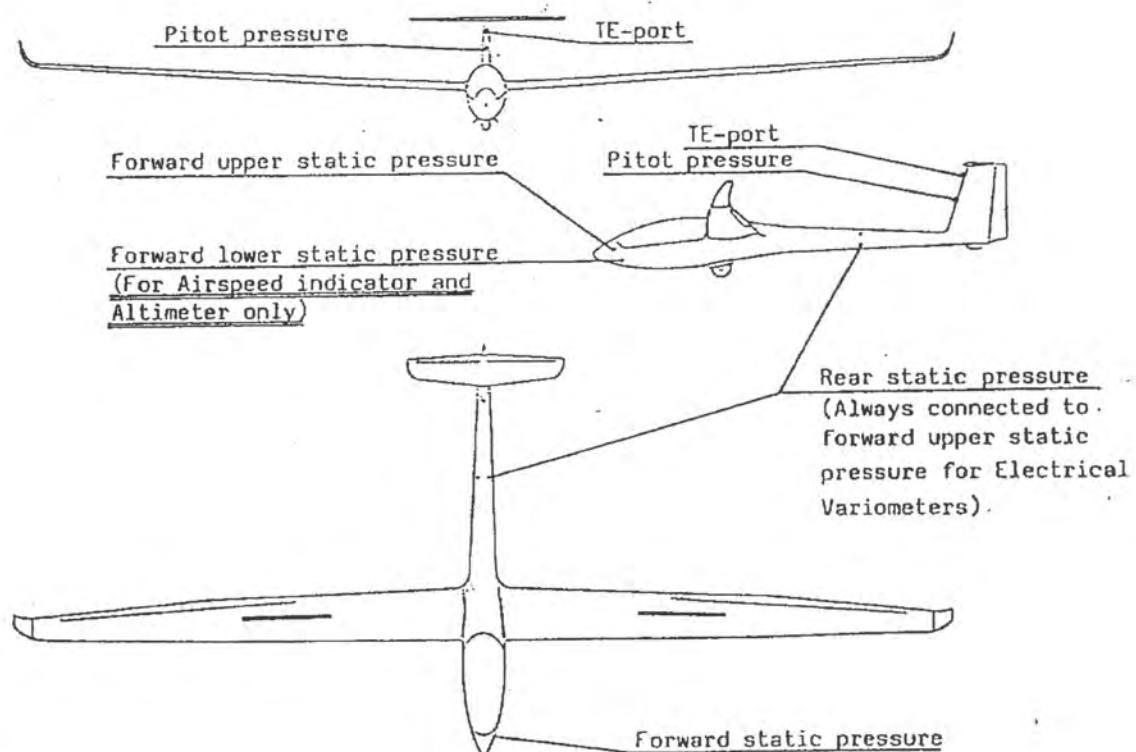

Aileron

local radius mm/in	10° to 13°	21° to 25°
83 mm 3.268	14 to 19 mm 0.551 to 0.748	30 to 36 mm 1.181 to 1.417
84 mm 3.307	15 to 19 mm 0.591 to 0.748	31 to 36 mm 1.220 to 1.417
85 mm 3.346	15 to 19 mm 0.591 to 0.748	31 to 37 mm 1.220 to 1.457
86 mm 3.386	15 to 19 mm 0.591 to 0.748	31 to 37 mm 1.220 to 1.457
87 mm 3.425	15 to 20 mm 0.591 to 0.787	32 to 38 mm 1.260 to 1.496
88 mm 3.465	15 to 20 mm 0.591 to 0.787	32 to 38 mm 1.260 to 1.496
89 mm 3.504	16 to 20 mm 0.630 to 0.787	32 to 39 mm 1.260 to 1.535
90 mm 3.543	16 to 20 mm 0.630 to 0.787	33 to 39 mm 1.299 to 1.535

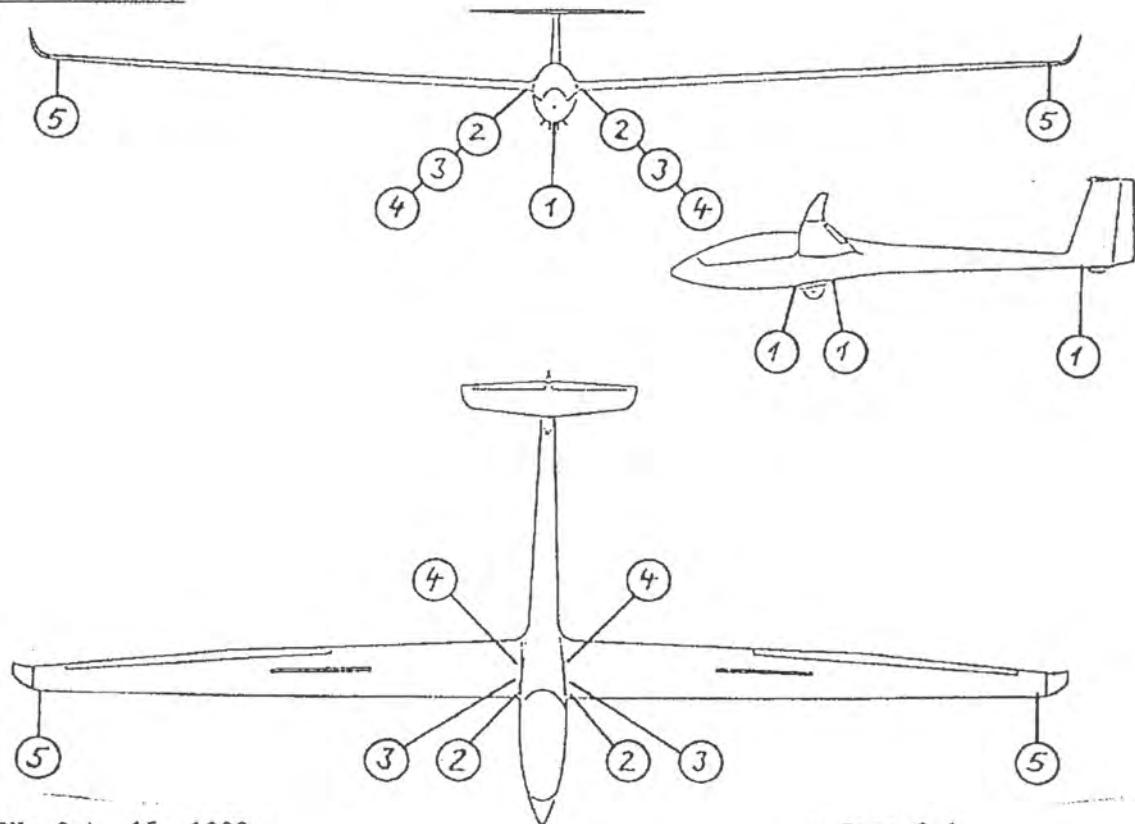

Rudder

local radius mm/in	26° to 30°
311 mm / 12.244 in	140 to 161 mm / 5.512 to 6.339 in
312 mm / 12.283 in	140 to 162 mm / 5.512 to 6.378 in
313 mm / 12.323 in	141 to 162 mm / 5.551 to 6.378 in
314 mm / 12.362 in	141 to 163 mm / 5.551 to 6.417 in
315 mm / 12.402 in	142 to 163 mm / 5.591 to 6.417 in
316 mm / 12.441 in	142 to 164 mm / 5.591 to 6.457 in
317 mm / 12.480 in	143 to 164 mm / 5.630 to 6.457 in
318 mm / 12.520 in	143 to 165 mm / 5.630 to 6.496 in

PLACARDS

For positions of placards see Flight Manual page 7-2.

LS7-WL CHECKLIST

This sailplane must be operated in compliance with operating limitations as stated in the form of markings, placards and Flight Manual.

1. Main pins secured ?
2. Horizontal tail secured ?
3. Wingtips secured ?
4. Test controls
5. Check loading conditions
6. Fasten seat belt harness
7. Connect parachute static line
8. Lock airbrakes
9. Trim neutral
10. Check release
11. Check tail dolly removed
12. Lock canopy

>1< at underside of instrument panel

<u>MINIMUM COCKPIT LOAD</u>	<u>kg/ lbs</u>
For use of lower Minimum Cockpit Load see Flight Manual pages 2-6 and 6-2	

under instrument panel cover >2<

### 11.1 PERMANENT INSTALLATION OF FIXED BALLAST

If empty weight C.G. position is too far back to allow 70 kg (154 lbs) as Minimum Cockpit Load, permanent installation of ballast (trim weights, 2.5 kg (5.5 lbs) each) under seat in front of control stick is possible.

A trim weight holder can be ordered as optional equipment. Weights should be fixed in flight direction, using large washers and self-locking nuts such that vibration will not allow weights to rotate.

One weight of 2.5 kg (5.5 lbs) shifts empty weight C.G. position approximately 17 mm (0.669 in) forward.

After permanent installation of fixed ballast, empty weight C.G. position should be redetermined by weighing. See Chapter 2.

In special cases empty weight C.G. position may be shifted rearward to allow heavy pilots to fly with rearward inflight C.G. positions.

Therefore it is possible to install a battery into the vertical tail fin (if a battery receptacle is fitted there) or a trim weight at the vertical tail fin web lower end using a rear trim weight holder. This holder is fitted to 4 mounting bolts of the elevator drive system and can be accessed after disassembly of the rudder.

**WARNING:** NEVER dismount the rear trim weight holder, bolts and nuts are fixing points for the elevator system.

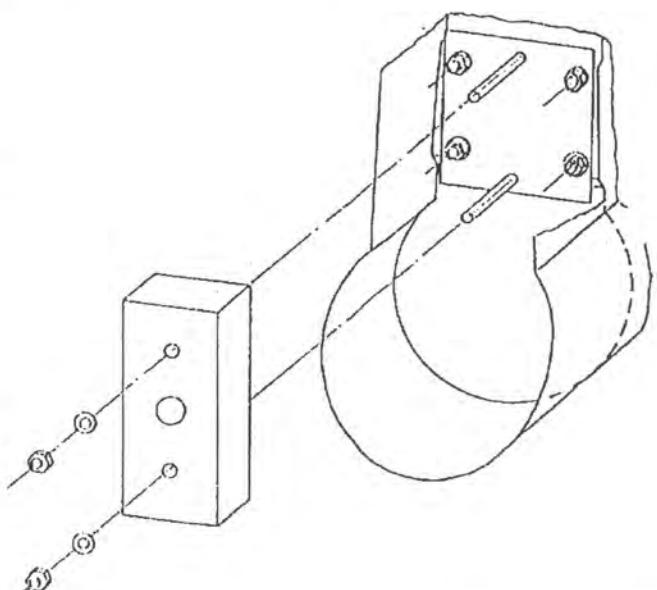

Maximum weight of rear trim weight: 2.45 kg (5.4 lbs), Part No. 4R8-108  
Tail fin battery type Dryfit or similar maintenancefree and gastight type,  
12V 5.7 Ah, measurements 150\* 99\* 33 mm (5.9\* 3.9\* 1.3 in)  
weight 2.6 kg (5.7 lbs)

All nuts self-locking M6, LN 9348,  
10 mm width over flats, washers  
B 6.4, DIN 9021-ST

For disassembly and assembly of rudder see Maintenance Manual, chapter 4. Pay special attention to unobstructed movement.

When fitting a trim weight to the vertical tail fin web, C.G. position must be redetermined by weighing according to chapter 2.

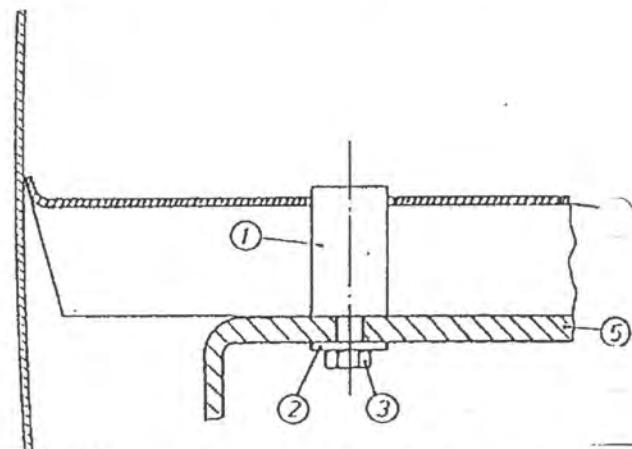

Trim weight installation at vertical tail fin web using rear holder (tail wheel box and lower rudder bearing bracket not shown)

11.2 PERMANENT INSTALLATION OF EQUIPMENT IN BAGGAGE COMPARTMENT  
Installation is possible as follows:

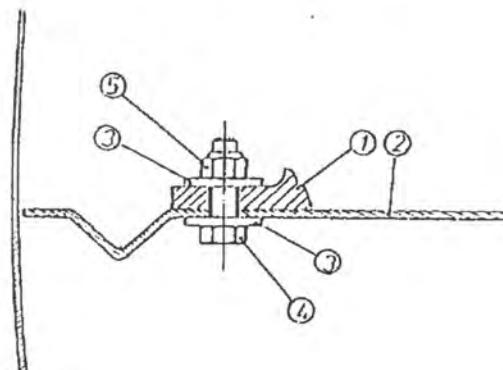

- a) Equipment must be attached to landing gear box using threaded spacers, three of which are necessary per unit. Baggage compartment cover has to be cut to avoid spacers. See sketch.

1. Spacer, diameter 15 mm (0.6 in), length 27 mm (1.1 in).
2. Washer B 5.3 DIN 9021-St outer diameter 15 mm (0.6 in)
3. Screw M5\*10 DIN 85-A2
4. Baggage compartment cover
5. Landing gear box

- b) Equipment may be fitted to rear baggage compartment cover >2< behind spar connection {barographs or ELT's only}, as near as possible to side stiffening corrugations. Use large washers >3< (DIN 9021, 15 mm (0.6 in) in diameter) and self-locking nuts >5< M5 LN 9348. See sketch below:

>1< mounting flange of equipment  
>4< bolt M5 LN 9037

SPECIFICATIONS FOR BASIC EQUIPMENT1) AIRSPED INDICATOR

Original certification was carried out using Winter 6FMS4-2 and 7FMS4-2 airspeed indicators with a range of 30 to 300 km/h and colour marking according to Flight Manual page 2-2.

A similar FAA approved airspeed indicator to meet TSO C2 reading to 300 km/h (160 kts, 180 mph) may be used. Maximum instrument error  $\pm 2\%$ . Colour marking must be according to Flight Manual page 2-2.  
Examples: AID 11-1002-1 or KI 8000

2) ALTIMETER

Original certification was carried out using Winter 4FGH10 or 4FGH20 altimeters with a range of 0-1000-10000 meters (approx. 33000 ft).

A similar FAA approved altimeter to meet TSO C10 with a range of approximately 33000 ft and a mercury or millibar subscale may be used.

When an altimeter of up to 20000 ft only is being used, a placard must be near the altimeter stating: Maximum flying altitude 20000 ft.  
(See also Flight Manual page 2-6, 2-7)

Examples: Kollsman Type 378222 or AID 13-2000-1 or AID 13-2000-5

3) MAGNETIC COMPASS

Original certification was carried out using an Airpath C 2400 compass.

Any FAA approved magnetic compass (non-stabilized type) to meet TSO C7 may be used.

Examples: Airpath C 2300

4) SEAT BELT HARNESS

Autoflug lap belt Bagu FAG-7H (Multiple point buckle)  
shoulder strap Schugu FAG-7H

Gadringer lap belt Bagu 5303 (multiple point buckle)  
shoulder strap Schugu 2700  
(Lap belt 5303 with bracket 4R11-22a sewn in.)

5) OPTIONAL INSTRUMENTS

a) Mechanical Variometer (Vertical Speed Indicator)  
Winter 5 StV5 or 5 StVM5 Bohli 68 PVF 1  
PZL WRS-5D Schuemans SV or CV

b) Electrical Variometer

All models of the following named manufacturers:  
Blumenauer - Flexum - Ilec - Peschges - Westerboer - Zander

c) Turn and Bank Indicator

Gauting WZ 402 models PZL EZS-3  
RC Allen 12W2D2A or 12W2D2S

d) Horizon Reference Indicator (Electrical Gyro Horizon)  
Gauting 6532/6 AIM 500-DCF  
RC Allen RCA 26 AK-4

6) ELECTRICAL INSTALLATION

- a) Battery Only life sealed batteries are recommended (Gel cell or Nickel-Cadmium types).  
Battery size must be chosen in relation to power requirements to guarantee 8 hours of continuous service. For "German" type radio plus electrical variometer 12V/5.7 Ah are adequate.  
Power requirement for average "German" type radio is 1.5 A for transmitting, 0.4 A for receiving voice and 0.06 A for standby.  
Examples: Dittel (Dryfit) 12V/6.5 Ah including battery holder for baggage compartment. Installation according to page 11-2, measurements 170\*73\*140 mm (length\*width\*height) <6.69\*2.87\*5.51 in>, weight 3.1 kg <6.8 lbs>. For tail fin batteries see page 11-1.

- b) Switches Marquardt 2A 250V or other manufacturers

- c) Fuses Microfuse 20\*5 mm DIN 41571 or Circuit Breakers Klixon 7277-2 or 7274-2 or similar ones  
Ratings: Master: 3 A (Minimum) quick acting  
10 A (Maximum) quick acting  
2 A quick acting: Radio Becker/Dittel  
1 A quick acting: Electrical variometers  
Turn and bank indicator

- d) Radio Walter Dittel FSG series  
Avionic Dittel ATR 720 models  
Becker AR 2000 and AR 3000 series  
Antenna Becker Antenna for vertical tail fin, 118-136 MHz

7) LANDING GEAR

- |                         |   |
|-------------------------|---|
| <u>Main wheel</u>       | Tost Kobold 103/20, 4 inch in diameter            |

9) REMOTE INDICATING THERMOMETER (Minimum equipment with vertical tail fin tank)  
Störk TF-00-059 K

Feeler gauge in ventilation duct or in landing gear box.

MATERIALS AND SOURCES OF SUPPLY

EPOXY RESIN: Shell Glycidäther (Epikote) 163  
<wings and horizontal tail unit>  
Glycidäther (Epikote) 162 <fuselage and vertical tail>  
with hardener: Shell Epikure 113 for both resin types  
EPOXY RESIN: Scheufler L 285 <all parts>  
with hardener: Scheufler 286 or 287

Mixture ratio for all resins: 38 parts per weight hardener for 100 parts  
of resin. After mixing stir thoroughly until  
all optical inhomogeneities have  
disappeared. Add filler material later.

FIBER GLASS FABRIC:

Alkalifree E-glass, Volan-A-finish or finish I-550 (Interglas)  
Manufacturer: Interglas Textil GmbH, Söflinger Str.246, 7900 Ulm

Interglas No.	Kind of weave	Weight g/(m*m)	Usage
90070	linen	79	elevator
92110	2/2 twill	163	rudder
92125	2/2 twill	280	local reinforcing
92145	Unidir. Plain	216	wing, fuselage
92146	Unidir. Plain	440	fuselage

CARBON FIBER FABRIC

Manufacturer: Interglas  
98320      linen      132      wins, spar boxes  
horizontal tail fin.

ARAMID FIBER FABRIC: (KEVLAR)

Manufacturer: Interglas  
98605      linen      61      aileron, elevator

POLYESTER FABRIC:

Manufacturer: P.A.Lückenhau & Co., Postfach 200805, 5600 Wuppertal  
34048      linen      206      fuselage

Most types of fabric may be substituted by other maker's types. Request materials list 4BA-1 in most up to date version.

FOAM:

PVC foam Divinycell H 60, 8 mm thick, weight 60 kg/(m\*m\*m) <wing>  
Manufacturer: Diab-Barracuda GmbH, Freudenthalstr. 25, 3000 Hannover 21

PVC foam Divinycell HT 70, 6/10 mm thick, weight 70 kg/(m\*m\*m) <spar web,  
horizontal tail>  
Manufacturer: Diab-Barracuda GmbH, Freudenthalstr. 25, 3000 Hannover 21

Foam Rohacell 71, 2.5 mm thick, weight 70 kg/(m\*m\*m) <control surfaces>  
Manufacturer: Röhm GmbH, Kirschenallee, 6100 Darmstadt

FILLER MATERIALS:

Microballon      Lackfabrik Bäder KG, Postfach 25, 7300 Esslingen  
Aerosil Type 200   A+E Fischer, Postfach 130202, 6200 Wiesbaden 13  
Cotton flocks  
Type FL1f      Schwarzwälder Textilwerke, Postfach 25, 7623 Schenkenzell

MATERIALS AND SOURCES OF SUPPLY continued

GELCOAT:

PE-Vorgelat white No. 03-69100	Manufacturer: Lesonal-Werke,
Hardener No. 07-20510	Postfach 300709, 7000 Stuttgart 30
Thinner No. 06-30260	

Mixture ratio 2% (weight) hardener. For spraying add 30 to 50% thinner.

UP-Vorgelat white T 35	Manufacturer: Martin G. Scheufler
Hardener SF 2	Kunstharzprodukte GmbH, Am Ostkai
Thinner SF	21/22 im Stuttgarter Hafen,

7000 Stuttgart 61 (Obertürkheim)

Mixture ratio 2% (weight) to 100% of hardener for brushing on.

For spraying: 10% (weight) to 100% of T 35, than add 2 to 3% of hardener

WARNING COLOUR:

Nitro Cellulose Kombilack	Manufacturer: Lackfabrik Bäder KG,
Reinorange RAL 2004 (orange) or	Postfach 25, 7300 Esslingen
Rot RAL 3000 (red)	

REPAIRS OF METAL FITTINGS should not be performed before the manufacturer has been consulted. Most fittings are made from 1.7734.4 aircraft material and welded in WIG-process (Shielded arc welding). In no case should they be gas welded, because required properties of the material will disappear.

CABLE SYSTEMS:

Rudder:	cable	B3.2 LN 9374
	cable sleeves	Nicopress 28-3-M, 3 pressings requ. with tool groove Oval M
	steel thimbles	A3.5 DIN 6899
Release mechanism and wheel brake:	cable	A2.4 LN 9374
		A2.4 LN 9389 corrosion resistant, (release system under seat)
	cable sleeves	Nicopress 28-2-G, 1 pressing requ. with tool groove J
	stop sleeves	Nicopress 871-17-J, 1 pressing requ. with tool groove 51-MJ
	steel thimbles	A2.5 DIN 6899

LONGITUDINAL MOTION PUSHROD BEARINGS

During repairs, never pull pushrods out of longitudinal motion bearings, because all balls will leave their cages. Consequently, for reinstallation near each bearing a hole must be cut and repaired afterwards. These bearings are being used throughout the wing control systems, in the fuselage for elevator-, aileron- and landing gear drive systems.

WARNING:

Longitudinal motion pushrod bearings should never be greased or oiled, their plastic balls and bearing surfaces will soon be destroyed due to collection of small foreign matter.

10. NOV. 1992 *W. Kappa*

Serial No. . . . .	Reg.Signs . . . . .	Date: . . . . .	WEIGHING REPORT
--------------------	---------------------	-----------------	-----------------

COMPONENT WEIGHTS (Check when equipment altered or every fourth year)

	Dimension		Dimension
Right Wing		Maximum all-up Weight	486 kg/1071 lbs
Left Wing		Maximum Weight of Non-lifting Parts at $W = . . . . . \text{kg/lbs}$ and $X_{cg} = . . . . . \text{mm/in}$ according to table pages 2-4/2-5	
Fuselage + Canopy + Main pins		Fuselage (completely equipped)	
Minimum Equipment permanently inst.		Horizontal tail	
Addit. Equipment		Cockpit Load (max.120 kg or 265 lbs)	
Horizontal Tail		Weight of Non-lifting Parts	
Empty Weight $\langle W \rangle$			
<u>FIXED BALLAST WEIGHT POSITION</u> . . . . . kg/lbs in Tail Fin / . . . . .		<u>BATTERY POSITION</u>	None Baggage Compartment Tail Fin

WEIGHING AND EMPTY WEIGHT C.G. DETERMINATION (Check when equipment altered  
or every fourth year)

Technical data according to TCDS: Datum Point  $\langle DP \rangle$ : Leading edge of wing at root  
Datum Line  $\langle DL \rangle$ : Under side of fuselage boom horizontal  
Dimension Dimension

Empty Weight $\langle W \rangle$		Distance Wheel axis - Datum Point $\langle a \rangle$	
Nett Tail Weight $\langle W_2 \rangle$		Distance Wheel axis - Tail support $\langle b \rangle$	

$$(W_2 + W_a) * b \quad * \quad mm \quad \text{with tail fin tank full} \quad * \quad mm \quad \text{with tail tank empty/not existent}$$

$$+ a = X_{cg} \quad + \quad = \quad in \quad + \quad = \quad in$$

$$W + W_a$$

Empty Weight . . . . . kg/lb  
Empty Weight C.G. range from . . . . . mm/in to . . . . . mm/in  
Cockpit load range from . . . . . kg/lb to . . . . . kg/lb  
from . . . . . mm/in to . . . . . mm/in  
from . . . . . kg/lb to . . . . . kg/lb

MINIMUM COCKPIT LOAD: . . . . . kg / lbs with tail fin tank ( $W_a = 5.5/4.1$  Liters) full

MAXIMUM COCKPIT LOAD: . . . . . kg / lbs limited by: weight of non-lifting parts  
C.G. table

Weight and Balance Placard and Minimum Cockpit Load Placard in Cockpit as well as entry  
in Flight Manual Page 6-2 have been checked/updated.  
Equipment during weighing/calculation see Equipment List dated: . . . . .

NOTE: See also Maintenance Manual, Chapter 2  
State dimensions used. Redetermine distances  
a and b, because of possibly altered  
suspension level.

SERIAL-No.: _____	Reg.Signs: _____	CONTROL SURFACE DEFLECTIONS
-------------------	------------------	-----------------------------

Check control surface deflections annually

Date: \_\_\_\_\_

AILERON DEFLECTIONS, measure at inner edge

	Limit <°>	Actual <°>	Radius mm/in	Limit mm/in	Actual mm/in
LEFT up	21° to 25°				
	down 10° to 13°				
RIGHT up	21° to 25°				
	down 10° to 13°				

ELEVATOR Measure at outer edge, Radius \_\_\_\_\_ mm/in

	Limit <°>	Actual <°>	Limit mm/in	Actual mm/in
up	28° to 30°			
down	22° to 24°			

RUDDER Measure at lower edge, Radius \_\_\_\_\_ mm/in

	Limit <°>	Actual <°>	Limit mm/in	Actual mm/in
left	26° to 30°			
right	26° to 30°			

CONTROL SYSTEM FRICTION Check control surface friction/play annually

	Limit (grams/lbs)	Actual (g/lbs)	Point of measurement
Elevator	maximum 100 / 0.110		30mm/1.2in below stick end
Aileron	200-500 / 0.22-1.102		30mm/1.2in below stick end
Rudder	maximum 500 / 1.102		at lower rudder edge

CONTROL SURFACES REAR EDGE PLAY

Fix control stick at neutral position of control surface

Aileron maximum of 1.8 mm/0.071 in left: \_\_\_\_\_ mm/in

right: \_\_\_\_\_ mm/in

Elevator maximum of 2.4 mm/0.095 in \_\_\_\_\_ mm/in

Cross invalid dimensions!

ROLLADEN-SCHNEIDER Flugzeugbau GmbH	Maintenance Manual Checklist Annual Inspection	LS 7 LS 7-wl	Page 14-11 Edition Okt. 1999
--	---	-----------------	---------------------------------

Check air brakes for jamming/locking during retracting under load:

		Inspector
1	Check air brake levers in wing for corrosion at lower end.	
2	Check air brakes for jamming/locking during retracting under load: Simultaneously apply about 25 kg <55 lbs> to the rear at each lever without twisting upper member and retract.	
3	When under the load according to item 2 any kind of jamming on wing occurs, bearings must be replaced according to repair instruction "Air Brake Levers" immediately.	
4	With corrosion existent, but no jamming, bearings must be changed within 6 months.
